

Hi,

We are building an application to organize historical student data (data from Moodle forum and WebSubmission system). The Moodle data is related with students' events (e.g. USER0039 had a resource_view at 21/07/14, 16:16, the resource viewed is "File: Sample Exam"). The WebSubmission data includes assignment submission time, mark and repository version of each student. Lecturers and researchers are the intended users of the application.

We want to identify some commonly asked questions so that we can calculate the answers to these questions in our application. Based on the schema of Moodle and WebSubmission, how would you relate the data to the questions? (An example question is: After an assignment is released, when do students begin to download resources, when do they submit?) Please provide the questions you want our application to answer. Your ideas will be taken seriously and will have a chance to appear in our application.
